There are 9 squares involved with the 7, so $9 \times 7 = 63$ other squares. These other squares contain the 92 other mines. So the number of grids with a 7 at a particular spot is $8 \times 63 = 504$. That is out of a total of $8 \times 10^6 = 8,000,000$

Probability of getting a 7 in Minesweeper - Math Stack Exchange : questions : probability-of-getting-a-7-in-minesweeper

We have $492556 = 125244$ ways for an easy grid to have an 8 somewhere. Out of the 1.88 trillion total easy grids, this gives a probability of about $\frac{125244}{1.88 \times 10^{12}} \approx 6.66 \times 10^{-8}$. So, very rare indeed!

probability - How rare is it to get a $\$8$ in minesweeper?
